The invention relates to a novel collection of cultured cells, comprising at least 5 genotypically distinct cells, where each of the at least 5 genotypically distinct cells is coisogenic with respect to the others of the at least 5 genotypically distinct cells at a target locus common among them, and where each of the at least 5 genotypically distinct cells at a target locus common identifying genotypes of the collection of cells is useful for identifying genotypes of a target locus that alter a cellular phenotype. The collection is also useful for pharmacogenomic studies, and in studies of structure-activity relationships of existing, and of potential new, therapeutic agents permitting multiplex analysis of the effects of amino acid changes on ligand-receptor interactions. The sequences shown in ACC79391-ACC73974 represent human ABCB1 (MDR1) targeting oligos. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel collection of cultured cells, comprising at least 5 genotypically distinct cells, where each of the at least 5 genotypically distinct cells is coisogenic with respect to the others of the at least 5 genotypically distinct cells at a target locus common among them, and where each of the at least 5 genotypically distinct cells can be separately assayed. The collection of cells is useful for identifying genotypes of a target locus that alter a cellular phenotype. The collection is also useful for pharmacogenomic studies, and in studies of structure-activity relationships of existing, and of potential new, therapeutic agents permitting multiplex analysis of the effects of amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel cultured cell collection comprising at least 5 genotypically distinct cells each of which is coisogenic with respect to other cells at target locus common among them, useful for identifying target locus

                                                                                                                                                                                                                                            The invention relates to a novel set of probes for detecting relevant variants such as nucleotide substitutions, small deletions, repeated trained set. In a target group of genes that relate to adverse events. The probes of the invention may be useful in biological assays for detection of the gene variants, for measurement of differential gene expression levels and for assessing the genomic profile of a patient which may, in turn, be useful for general health screening, occupational health purposes, health care planning on a population basis and other health care management utilisations. The current sequence is that of a tyrgob (cytochrome 9450 206) SNP (single nucleotide polymorphism)-targeted probe of the invention which may be used to assess an individual's risk of drug toxicity on the basis that variation in genes affects them absorption, distribution, metabolism and elimination (ADME)
                                                                                                                                                        Set of probes for detecting relevant variants in target genes relating to adverse events, comprises nucleotide probes complementary to DNA and RNA sequences of genes such as apolipoprotein E gene, or angiotensinogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diagnosis; prophylaxis; hepatitis B infection; hepatitis C infection; hepatitis D infection; drug-induced hepatotoxicity; liver tumor; liver cirrhosis; fibrosis; autoimmune hepatitis; primary biliary cirrhosis; primary sclerosing cholangitis; hemochromatosis; Milson's disease, alpha-1 antitrypsin deficiency; celiac disease; amyloidosis; gastrointestinal disease; metabolic disorder; inflammation, cardiant; antiinflammatory; hepatotropic; virucide; gastrointestinal-gen.; cns-gen.; metabolic; immunosuppressive; cytostatic; cytochrome P450 2D6; CYP2D6; ds; SNP; single nucleotide polymorphism; chromosome-22.

The invention relates to a method of determining if an individual is predisposed to fast progression of liver fibrosis or liver cirrhosis comprising determining a presence or absence, in a homozygous or heteroxygous form, of at least one fast progression liver fibrosis.

Comprising determining a presence or absence, in a homozygous or neighboring loci of the individual, where the neighboring loci is in no linkage disequilibrium with the locus, thus determining if the individual is predisposed to fast progression of liver fibrosis; a kit to carry out is predisposed to fast progression of liver fibrosis in an individual, by upregulating CYPDE expression and/or activity; and a method of determining if a drug molecule is capable of inducing or accelerating development of fast progression of liver fibrosis in an individual. The individual is suffering from a hepatitis viral infection caused by hepatitis B, C or D virus, a hepatotoxicity (alcohol- or drug-induced), a liver cancer, a non-alcoholic fatty liver disease (NAFLD), an autoimmune disease (autoimmune hepatitis (AIH), primary biliary cirrhosis (PBC), or primary sclerosing cholangitis (PSC)), a metabolic liver disease with secondary involvement of the liver (celiac disease and/or amyloidosis). The method and kit are useful for determining if an individual is predisposed to fast progression of liver fibrosis. The method and drug are useful for preventing liver cirrhosis and solved and evale are useful for preventing liver cirrhosis progression of liver fibrosis. This sequence is human cyccohrome P450 2D6 DNA located on chromosome 22q13.1, showing the CYP2D6*4 single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining if an individual is predisposed to fast progression of liver fibrosis comprises determining a presence or absence of at least one fast progression liver fibrosis-associated genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variation site; analysing; point mutation; detecting pathogen; SNP; single nucleotide polymorphisms; paternity dispute; prenatal testing; forensic analysis; CYP450.2D6.G1749C; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                               The invention relates to a method for analysing a variation site in a target polynucleotide. The method comprises contacting the target polynucleotide with multiple copies of a primer hybridising adjacent to, but not including, the variation site in the presence of a mixture of labelled and unlabelled forms of a nucleotide under conditions such that a copy of the primer is extended by incorporation of a labelled a complementary to a base occupying the variation site in the target polynucleotide, detecting the labelled nucleotide incorporated into the primer as an indication of the variation site base. The methods into the primer and single nucleotide polymorphisms (SNP), and confiding point mutations and single nucleotide polymorphisms (SNP), and cor detecting pathogens, paternity disputes, prenatal testing and for enersic analysis. This polymucleotide sequence represents the DNA of an amplifier containing the CVP450.2D6.G1749C SNP relating to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /*tag= a

Set of probes for detecting relevant variants in target genes relating to adverse events, comprises nucleotide probes complementary to DNA and RNA sequences of genes such as apolipoprotein E gene, or angiotensinogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel set of probes for detecting relevant variants such as nucleotide substitutions, small deletions, repeated variations etc. in a target group of genes that relate to adverse events. The probes of the invention may be useful in biological assays for detection of the gene variants, for measurement of differential gene expression levels and for assessing the genomic profile of a patient which may, in turn, be useful for general health screening, occupational health purposes, health care planning on a population basis and other health care management utilisations. The current sequence is that of a CYP2D6 (cytochrome p450 2D6) SNP (single nucleotide polymorphism)-targeted probe of the invention which may be used to assess an individual's risk of drug toxicity on the basis that variation in genes affects the absorption, distribution, metabolism and elimination (ADME)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The invention relates to a method of detecting single-nucleotide polymorphisms (SNPs) in human CYP2 genes using specified primers and/or probes. The method comprises detection of the CYP2 alleles in artificial plasmids. The primers are used in a hybridisation assay to detect alleles in genomic DNA, from both homozygous and heterozygous carriers. The assay comprises labelling one primer per gene segment with biotin, amplifying the comprises labelling one primer per gene segment with biotin, amplifying the contaminating genomic DNA and the complementary strands by stringent washing, hybridising the bound single-stranded amplicon to an allelegency in the unbound oligonucleotide by ELISA using an antibody against FITC that the conjugated to horseradish peroxidase. The method is useful for the conjugated to horseradish peroxidase. The method is useful for that the conjugated to horseradish peroxidase. The method ist useful for the conjugated to horseradish peroxidase. The method ist useful for the conjugated to horseradish peroxidase. The method ist useful for the conjugated to horseradish peroxidase. The method ist useful for the conjugated to horseradish the co

This invention describes a novel method of detecting the presence of single nucleotide polymorphisms (SNPs) in human CYP2-genes using a priming agent and/or a probe, where the priming agent effects high-resolution amplification of the respective CYP2 allelomorph. The method can be incorporated into a diagnostic kit that detects the presence of polymorphisms in human cytochrome P450 genes comprising a synthetic oligonucleotide that amplifies isoform-specific (IS-PCR) polymer chain reactions using a DNA polymerase chain reaction. The kit components relatively immobilize single-stranded biotinized IS-PCR products on streptavidin-coated micro-titration slides under stable thermal carefully immobilize single-stranded biotinized fluorescein creptavidin-coated micro-titration slides under stable thermal carefully conditions. Test-optimized, allelmorph-specific, fluorescein conditions rest-optimized, allelmorph-specific incorporate (AITC) marked synthetic oligonucleotides facilitate accurate identification of the genotype of the immobilized amplification products through a sequence of hybridization, subsequent washing and detection by fluoreneity or photometry. The novel diagnostic process is rapid and cost-effective. This sequence represents a plasmid fragment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting single-nucleotide polymorphisms in human CYP2 genes, useful for diagnosis of pharmaceutical intolerances, using specific primers or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polymorphisms (SNPs) in human CYP2 genes using specified primers and/or probes. The method comprises detection of the CYP2 alleles in artificial plasmids. The primers are used in a hybridisation assay to detect alleles in genomic DNA, from both homozygous and heterozygous carriers. The assay comprises labelling one primer per gene segment with biotin, amplifying the allele-defining gene segments by PCR, binding the labelled amplicon to heat-stable streptavidin (St)-coated plates, removing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of detecting single-nucleotide

used in the detection method of the invention.

```
This invention describes a novel method of detecting the presence of single nucleotide polymorphisms (SNPs) in human CYP2-genes using a priming agent and/or a probe, where the priming agent effects high-cresolution amplification of the respective CYP2 allelomorph. The method can be incorporated into a diagnostic kit that detects the presence of polymorphisms in human cytochrome P450 genes comprising a synthetic coligonucleotide that amplifies isoform-specific (IS-PCR) polymer chain reactions using a DNA polymerase chain reaction. The kit components selectively immobilize single-stranded biotinized IS-PCR products on transplantion-coated micro-titration slides under stable thermal conditions. Test-optimized, allelmorph-specific, fluorescein isothiocyanate (FITC)-marked synthetic oligonucleotides facilitate curate identification of the genotype of the immobilized amplification products through a sequence of hybridization, subsequent washing and detection by fluorometry or photometry. The novel diagnostic process is rapid and cost-effective. This sequence represents a plasmid fragment
                                                                                                                                                                                                                                                                                                             ö
contaminating genomic DNA and the complementary strands by stringent washing, hybridising the bound single-stranded amplicon to an allelespecific FTVC (fluorescein isochiocyanate)-labelled oligonucleotide, removing the unbound oligonucleotide by washing, and detecting the allelespessented oligonucleotide by ELISA using an antibody against FTVC that is conjugated to horseradish peroxidase. The method is useful for detecting SNPs in CYP2 genes that are associated with an absence, or reduction, of enzymatic activity, particularly for diagnosis of intolerances of pharmaceuticals. This sequence represents CYP2 plasmid DNA used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        single nucleotide polymorphism agent.
                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a method for inferring a genetic pigmentation trait of a human. The method involves identifying a single nucleotide bolymorphism (SNP) in a pigmentation gene — where the pigmentation gene is not melanocortin-1 receptor (MCIR) and agouti signaling protein (ASIP). The method of the invention is useful for inferring a genetic pigmentation trait of a human, especially for inferring the race of a human subject. The method is useful for inferring a genetic pigmentation relation to a solour, or eye shade or colour of a human subject. The method may be used as a forensic tool for obtaining subject. The method may be used as a forensic tool for obtaining information relating to physical characteristics of a potential crime victim or, a perpetrator of a crime from a nucleic acid sample present at a crime scene. The present human DNA sequence is used in the
                                                                                                                                                                                                                                                                                                                                                               Human, single nucleotide polymorphism; SNP; ds; melanocortin-1 receptor; genetic pigmentation trait; MCIR; agouti signaling protein; ASIP; race; hair colour; eye colour; forensic tool.

The present sequence is that cDNA corresponding to one allelic variant of the human cytochrome P450 2D6. The present invention relates to a method of detecting a G1846A single nucleotide polymorphism (SNP) in the gene sequence of human cytochrome P450 2D6 which metabolizes various clinically important drug compounds including beta-blockers, antiarrhythmic drugs and antihistamine drugs. This SNP causes a less rapid metabolism of such drugs and increases the risks (e.g. side effects) associated with them. The method of the invention involves amplifying the region containing the G1846A polymorphism by PCR, binding a fluorescently labeled nucleic acid probe targeted to this region and producing a melting temperature curve by measuring the fluorescent signal at differing temperatures. This melting temperature curve is then analyzed and the variant present is determined.
                                                                                                                                                                   ss; coding sequence; drug metabolism; cytochrome P450 2D6; CYP 2D6; SNP; single nucleotide polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel nucleic acid probe labeled by fluorescent dye at 3' terminal, useful for detecting single nucleotide polymorphism G1846A in cDNA of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for inferring a statin response from a nucleic acid sample comprising identifying in the nucleic acid sample, at least one haplotype allele indicative of a statin response. The haplotype allele may comprise nucleotides of the cytochrome p450 3A4 (CYP3A4) gene, nucleotides of the cytochrome p450 2B6 (CYP2D6) gene or nucleotides of the 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGCR) gene. The method of the invention may be useful for inferring a statin response of a human subject from a nucleic acid sample, where the human subject is a Caucasian subject and the statin is atorvastatin or sinwastatin. The method may also be useful for determining whether to prescribe statin to a patient with elevated serum cholesterol levels in order to prevent heart attack. The current sequence is that of the human lipitor/zocor response-related SNP DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inferring a statin response from a nucleic acid sample, by haplotype allele indicative of statin response, a decrease in total cholesterol, in low density lipoprotein infers a statin response of the subject.

The present sequence is that cDNA.corresponding to one allelic variant of the human cytochrome P450 2D6. The present invention relates to a method of detecting a G1846A single nucleotide polymorphism (SNP) in the gene sequence of human cytochrome P450 2D6 which metabolizes various clinically important drug compounds including beta-blockers, antiarrhythmic drugs and antihistamine drugs. This SNP causes a less rapid metabolism of such drugs and increases the risks (e.g. side effects) associated with them. The method of the invention involves amplifying the region containing the G1846A polymorphism by PCR, binding producing a melting temperature curve by measuring the fluorescent signal at differing temperatures. This melting temperature curve is then analyzed and the variant present is determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                :

The invention relates to a method of detecting single-nucleotide polymorphisms (SNPB) in human CYP2 genes using specified primers and/or probes. The method comprises detection of the CYP2 alleles in artificial plasmids. The primers are used in a hybridisation assay to detect alleles in genomic DNA, from both homozygous and heterozygous carriers. The assay comprises labelling one primer per gene segment with blotin, amplifying the allele-defining gene segments by PCR, binding the labelled amplicon to neat-stable streptavidin (St)-coated plates, removing the contaminating genomic DNA and the complementary strands by stringent washing, hybridising the bound single-stranded amplicon to an allele-specific FITC (fluorescein isothiocyanate)-labelled oligonucleotide, commoning the unbound oligonucleotide by washing, and detecting the allele presented oligonucleotide by ELISA using an antibody against FITC that is conjugated to horseradish peroxidase. The method is useful for detecting SNPs in CYP2 genes that are associated with an absence, or reduction, of enzymatic activity, particularly for diagnosis of the properticals and the complement of parameter of pharmaceuticals. This sequence represents CYP2 plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                               polymorphisms (SNPs) in human CYP2 genes using specified princrs and/or probes. The method comprises detection of the CYP2 alleles in artificial plasmids. The princrs are used in a hybridisation assay to detect alleles in genomic DNA, from both homozygous cherczygous carriers. The assay comprises labelling one princr per gene segment with biotin, amplifying the allele-defining gene segments by PCR, binding the labelled amplicon to heat-stable streptavidin (St)-coated plates, removing the contaminating genomic DNA and the complementary strands by stringent washing, hybridising the bound single-stranded amplicon to an allele-specific FITC (fluorescein isothiocyanate)-labelled oligonucleotide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              removing the unbound oligonucleotide by washing, and detecting the allele presented oligonucleotide by ELISA using an antibody against FITC that is conjugated to horseradish peroxidase. The method is useful for detecting SNPs in CYP2 genes that are associated with an absence, or
                                                                                                                                                                 single-nucleotide polymorphisms in human CYP2 genes, useful for of pharmaceutical intolerances, using specific primers or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Process for demonstrating the presence of single nucleotide polymorphism in human genes, comprises using a priming agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             reduction, of enzymatic activity, particularly for diagnosis of intolerances of pharmaceuticals. This sequence represents CYP2 plasmid DNA used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytochrome P450 2; diagnostic; cytochrome P450;
isoform-specific polymer chain reaction; IS-PCR; plasmid; circular.
                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of detecting single-nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Process for demonstrating the presence of single nucleotide polymorphism in human genes, comprises using a priming agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method of detecting the presence of single nucleotide polymorphisms (SNPs) in human CYP2-genes using a priming agent and/or a probe, where the priming agent effects high-resolution amplification of the respective CYP2 allelomorph. The method can be incorporated into a diagnostic kit that detects the presence of polymorphisms in human cytochrome P450 genes comprising a synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for continuous monitoring of polynucleotide amplification from the hybridisation of a labelled oligonucleotide conjugate to the amplified target. The labelled oligonucleotides are used for (real-time) monitoring of amplification and gene expression; to detect single-nucleotide polymorphisms; to detect a rarget in a mixture with related sequences; and to distinguish between wild-type, mutant and heterozygous target polynucleotides. The present sequence is human cytochrome P450 2D6 (CXP2D6) gene. This sequence is
                reactions using a DNA polymers chain reaction. The kit components selectively immobilize single-stranded biotinized IS-PCR products on streptavidin-coarded micro-titration slides under stable thermal conditions. Test-optimized, allelmorph-specific, fluorescein isothiocyanate (FITC) marked synthetic oligonucleotides facilitate accurate identification of the genotype of the immobilized amplification products through a sequence of hybridization, subsequent washing and detection by fluorometry or photometry. The novel diagnostic process is rapid and cost-effective. This sequence represents a plasmid fragment used in the detection method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inferring genetic pigmentation trait such as \text{hair/eye} color or shade from nucleic acid sample of human subject, by identifying a pigmentation-related haplotype allele of a pigmentation gene in the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises a method for inferring a genetic pigmentation trait of a human. The method involves identifying a single nucleotide bolymorphism (SNP) in a pigmentation gene - where the pigmentation gene is not melanocortin-1 receptor (MCIR) and agouti signaling protein (ASIP). The method of the invention is useful for inferring a genetic pigmentation trait of a human, especially for inferring the race of a pigmentation trait such as hair shade or colour, or eye shade or colour of a human subject. The method may be used as a forensic tool for obtaining subject. The method may be used as a forensic tool for obtaining information relating to physical characteristics of a potential crime victim or a perpetrator of a crime from a nucleic acid sample present at a crime scene. The present human DNA sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, single nucleotide polymorphism; SNP; ds, melanocortin-1 receptor; genetic pigmentation trait; MCIR; agouti signaling protein; ASIP; race; hair colour; eye colour; forensic tool.

nucleic acid sequence using amplification technique. The method involves amplification technique. The method involves primers to form amplification products, hybridising a first labelled probe to the target sequence amplification product and a second labelled probe to the standard sequence amplification product, detecting the signals from the first and the second probe, and comparing the signals from the first and the second probe, and comparing the signals to determine the polymorphism. The method is useful for detecting polymorphism in various nucleic acid sequences e.g. CYP2D6 gene which is member of cytochrome P450 (CYP) gene family. CYP2D6 glass which is metabolism of several drugs, including those used for treating psychiatric and cardiovascular disorders. Polymorphism in the CYP2D6 gene method is suitable for detecting amplification products from multiple and different types of polymorphisms on a single automated platform. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for detecting polymorphism in a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a mutation in target nucleic acid sequence in test sample, amplifying target and standard nucleic acid sequence using primers, hybridizing probes to the products to form hybrids, and detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for inferring a statin response from a nucleic acid sample comprising identifying in the nucleic acid sample, at least one haplotype allele indicative of a statin response. The haplotype allele may comprise nucleotides of the cytochrome p450 3A4 (CYP3A4) gene, nucleotides of the cytochrome p450 2D6 (CYP2D6) gene or nucleotides of the 3-hydroxy-3-methylglutaryl-coenzyme A reductase (HMGCR) gene. The method of the invention may be useful for inferring a statin response of a human subject from a nucleic acid sample, where the human subject is a Caucasian subject and the statin is actorvastatin or simwastatin. The method may also be useful for determining whether to prescribe statin to a patient with elevated serum cholesterol levels in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prescribe statin to a patient with elevated serum cholesterol levels in order to prevent heart attack. The current sequence is that of the human lipitor/zocor response-related SNP DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inferring a statin response from a nucleic acid sample, by haplotype allele indicative of statin response, a decrease in total cholesterol, in low density lipoprotein infers a statin response of the subject.
                                                                                                                                                                                                                                                                                                    statin response; cytochrome p450 3A4; CYP3A4; 2D6; CYP2D6; 3-Mydoxy, 3-methylghtuaryl-consryme A reductase; HWGCR; atorvastatin; serum cholesterol level; heart attack; sinvastatin; serum cholesterol level; heart attack; sinvastatin; serum cholesterol level; heart attack; sinvastatin; sinvastatin; serum cholymorphism; SNP; human; ds; lipitor; zocor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Inferring genetic pigmentation trait such as hair/eye color or shade from nucleic acid sample of human subject, by identifying a pigmentation-related haplotype allele of a pigmentation gene in the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises a method for inferring a genetic pigmentation trait of a human. The method involves identifying a single nucleotide bolymorphism (SNP) in a pigmentation gene - where the pigmentation gene is not melanocortin-1 receptor (MCIR) and agouti signaling protein (ASIP). The method of the invention is useful for inferring a genetic pigmentation trait of a human, especially for inferring the race of a human subject. The method is useful for inferring a genetic pigmentation trait such as hair shade or colour, or eye shade or colour of a human subject. The method may be used as a forensic tool for obtaining information relating to physical characteristics of a potential crime victim or a perpetrator of a crime from a nucleic acid sample present at exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       primer set, variant identification; cytochrome P450 isoenzyme 2D6; CYP2D6; chromosome 22q13.1; single nucleotide polymorphism; SNP; low frequency variant; pharmaceutical drugs metabolism; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inferring genetic pigmentation trait such as hair/eye color or shade from nucleic acid sample of human subject, by identifying a pigmentation-related haplotype allele of a pigmentation gene in the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for inferring a genetic pigmentation trait of a human. The method involves identifying a single nucleotide bolymorphism (SNP) in a pigmentation gene - where the pigmentation gene is not melanocortin-1 receptor (MCIR) and agouti signaling protein (ASIP). The method of the invention is useful for inferring a genetic pigmentation trait of a human, especially for inferring the race of a human subject. The method is useful for inferring a genetic pigmentation trait such as hair shade or colour, or eye shade or colour of a human subject. The method may be used as a forensic tool for obtaining subject. The method may be used as a forensic tool for obtaining information relating to physical characteristics of a potential crime victim or a perpetrator of a crime from a nucleic acid sample present at a crime scene. The present human DNA sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, single nucleotide polymorphism; SNP; ds; melanocortin-1 receptor; genetic pigmentation trait; MCIR; agouti signaling protein; ASIP; race; hair colour; eye colour; forensic tool.

                                                                                                                      This invention relates to novel primer sets that can be used to screen a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. The gene is located on chromosome 22q13.1 and contains several single nucleotide polymorphisms, the details of which are disclosed in the specification. The methods and compositions of the present invention are useful for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene metabolism. The present is equence is that of a human cytochromome P450 isoenzyme 2D6 gene metabolism. The present sequence is that of a human cytochromome P450 isoenzyme 2D6 pseudogene which was used during the design of the primer sets of the invention to ensure specific amplification of the correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel primer set for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene in a polynucleotide sample or a population.
                                           New primer set useful for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene, and for detecting low frequency variants affecting pharmaceutical drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a primer set that can be used to screen

cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. Also disclosed is a kit for the above screening method, a method for predicting the potential for altered metabolism of a substance, including one or more than one conditionally by a first individual compared to a second control individual, where the substance is metabolised by the CYP2D6 isoenzyme, a purified or isolated variant of wild-type CYP2D6 isoenzyme having one or more than one of the alterations chosen from F-I at position 120, F-F at position 120, E-K at position 155, R-R at position 120, F-F at position 354, H-H at position 314, N-F at position 344, Y-CC at position 355, H-H at position 314, N-F at position 361, V-FRAMESHIFT at position 343, R-CC at position 418, H-Y at position 314, V-FRAMESHIFT at position 361, CC at position 418, H-Y at position 361, V-FRAMESHIFT at position 363, B-K at position 478 and F-F at position 483. The primer set is useful for screening a polynucleotide sample to detect and identify the presence of one or more than one variant in the CYP2D6 gene in the sample. The primer set permits amplification from a small cypland-locitide sample of selected portions of the coding portion of the CYP2D6 gene, or amplification of the entire coding portion of CYP2D6, as well as the flanking intronic sequences that are relevant to recognition conferences. The primer set further permits the detection of genetic variants of CYP2D6 without interference from pseudogenes or from charmants that the flanking introduced metabolic me
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic polymorphisms of CYP2D6 gene in human population for analysis of drug effect on individual patients and testing of new drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention comprises mutant forms of the human CYP2D6 gene, containin or more of the following mutations G125A, C1858T, T2874C and C2875T. mutant human CYP2D6 genes of the invention are useful for analysing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         affect pharmaceutical drugs metabolism, thereby decreasing the false negative rate in variant screening. The present sequence represents a

The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPS) within the sequences. The methods, nucleic acid, oligomucheotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of predicting the responsiveness of a subject with a cell proliferative contaction and the acid proliferative is used the present sequence is used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cytostatic activity, and may have a use in gene therapy. The set of oligomolecoides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) within the sequences. The methods, nucleic acid, oligomucleotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorder of the breast tissues to a therapy. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         proliferative

   ö
                                                                                                                                                                                                                                 The invention relates to sequence determination oligonucleotides for detecting polymorphic sites in a 5' flanking region of cytochrome P450 2D6 (CYED56) gene. CYED56 enzymes are involved in the metabolism of many different xenobiotics. Human CYP2D6 gene is located on chromosome 22. The oligonucleotides may be used as in situ hybridisation probes, in ligase-based sequence determination, as components of diagnostic assays, as probes in sequence determination methods based on mismatches, as hybridisation-based diagnostic assays, and as components of diagnostic microarray. CYP2D6 is useful to predict variations in an individual: a ability to metabolise certain drugs. The present sequence is human CYP2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, ds, gene; cytochrome P450, CYP2D6; chromosome 22; SNP;

The invention relates to an isolated nucleic acid comprising a cytochrome P450 2D6 gene variant, e.g. G5799C or C5816AT (referring to the genomic sequence or the same variant nucleotide in the corresponding cDNA sequences). Also included are probes, primers (allele specific oligonucleotides) and arrays used to detect and or amplify the CYP2D6 coligonucleotides) and arrays used to detect and or amplify the CYP2D6 gene polymorphic regions, the variant polypeptides, antibodies which are capable of distinguishing between the variant and wild-type polypeptides, determining whether a subject has a genetic deficiency for metabolising a determining whether an individual is susceptible to being a poor metaboliser of drugs. The DNA probe is useful for hybrisiding to a variant form of the CYP2D6 gene. The primer is useful for amplifying the CSB16TA allelic variant. The methods are useful for determining whether a subject has a genetic deficiency for metabolising a determining whether a subject has a genetic deficiency for metabolising determining if an individual is susceptible to being a poor metabolising cold drugs. The nucleic acids are useful as probes or primers for determining whether a subject has a genetic deficiency for metabolising cold drugs. The nucleic acids are useful as probes or primers for determining whether a subject has a genetic deficiency for metabolising cold are useful as probes or primers for determining if a subject has a genetic deficiency for metabolising cold are useful as probes or primers for determining and activity, e.g. an aberrant level of a CYP2D6 procein or an aperrant cYP2D6 bloactivity. The methods are also useful in selecting the asubject to treat cardiovascular or psychiatric disorders, or for a subject to treat cardiovascular or psychiatric disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a subject to treat cardiovascular or psychiatric disorders, or for treating a subject with a drug sensitivity or disorder associated with a greefic allelic variant of a polymorphic region of the CYP2D6 gene. The antibodies are useful for monitoring CYP2D6 protein levels in an individual for determing whether a subject has a disease or conditions associated with an aberrant CYP2D6 protein level. The gene is located on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New cytochrome P450 2D6 gene variants and polypeptides, useful for determining if a subject has or is at risk of developing a drug sensitivity condition or disorder that is associated with an aberrant

The present sequence comprises the human cytochrome P450 CYP2D6 wild-type gene. CYP2D6 polymorphisms serve as genetic markers for CYP2D6 metabolic gene. CYP2D6 polymorphisms serve as genetic markers for CYP2D6 metabolic capacity. The invention relates to the use of setrones (antiemetics) for treating and/or preventing setrone-treatable diseases in a subject having in its genome fewer than 3 copies of a polynucleotide encoding a functional CYP2D6 polypeptide. The subject has at least one first variant allele selected from: CYP2D6*1, CYP2D6*5, CYP2D6*7, CYP2D6*8, CYP2D6*11, CYP2D6*12, and preferably has at least confering a liest variant allele selected from: CYP2D6*1, CYP2D6*2, CYP2D6*3, CYP2D6*3, CYP2D6*3, CYP2D6*3, CYP2D6*1, CYP2D6*2, and CYP2D6*1, CYP2D6*2, and Least an intered (decreased) expression. The treatment regimen can be modified according to the genotype of the subject is CYP2D6 and/or HTR3B gene. Non-responders to antiemetic therapy, can be identified on a pharmacogenetic basis, allowing a suitable therapy, and/or vomiting acceptaminophen poisoning, chemotherapy, radiation therapy, and opioid treatment, spinal or epidural opioid-conference processes of practice levodopa-induced psychosis, bulimia nervosa, fibromyalgia, chronic fatigue syndrome, opioid withdrawal syndrome, schizophrenia, alcoholism, cocaine addiction, opioid withdrawal syndrome,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of setrones for preparing a pharmaceutical composition for treating or preventing setrone-treatable diseases in a subject having in its genome less than three copies of a polynucleotide encoding a functional CYP2D6 polypeptide.

                                                                                                                                                                                                                                                                    ö
                    This invention relates to novel primer sets that can be used to screen a polynucleotide sample to detect and identify variants in the cytochtgome P450 isoenzyme 2D6 (CYP2D6) gene. The gene is located on chromosome 22q13.1 and contains several single nucleotide polymorphisms, the details of the present invention are useful for screening a polymucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene and detecting low frequency variants affecting pharmaceutical drugs metabolism. The present sequence is that of the gene which encodes the wild-type human cytochrome P450 isoenzyme 2D6 protein and which is related to the invention. Note: This sequence contains introns, the number and location of which are not disclosed within the specification. As well as the featured SNPs, an exon 9 gene conversion is also claimed in claim 25 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a primer set that can be used to screen an oldentify variants in the human cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. Also disclosed is a kit for the above screening method, a method for predicting the potential for altered metabolism of a substance, including one or more than one pharmaccutical drug, by a first individual compared to a second control individual, where the substance is metabolised by the CYP2D6 isoenzyme, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel primer set for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene in a polynucleotide sample or a population.

purified or isolated variant of wild-type CYP2D6 isoenzyme having one or more than one of the alterations chosen from F-I at position 120, F-F at position 120, E-K at position 155, R-R at position 120, F-F at position 120, L-L at position 276, H-H at position 324, R-STOP at position 344, Y-C at position 355, H-H at position 361, V-FRAMESHIFT at position 363, E-K at position 355, H-H at position 361, V-FRAMESHIFT at position 363, E-K at position 483. The primer set is useful for screening a polynucleotide sample to detect and clentify the presence of one or more than one variant in the CYP2D6 gene in the sample. The primer set permits amplification from a small polynucleotide sample of selected portions of the coding portion of the CYP2D6 gene, or amplification of the entire coding portion of CYP2D6, as well as the flanking intronic sequences that are relevant to recognition completes. The primer set further permits the detection of genetic variants of CYP2D6 without interference from pseudogenes or from complete set also permits the detection of low frequency variants that affect pharmaceutical drugs metabolism, thereby decreasing the false negative rate in variant screening. The present sequence represents human companies are in variant screening. The present sequence represents human companies are the companies of chromosome 22q13.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of determining if an individual is predisposed to fast progression of liver fibrosis or liver cirrhosis comprising determining a presence or absence, in a homozygous or cheterozygous form, of at least one fast progression liver fibrosis associated genotype in the CYP2D6, CYP3A5, CYP2E1, or APO E locus or in elighboring loci of the individual, where the neighboring loci is in in linkage disequilibrium with the locus, thus determining if the individual is predisposed to fast progression of liver fibrosis; a kit to carry out the method; a method of preventing fast progression of liver fibrosis in an individual, by upregulating CYP2D6 expression of liver fibrosis in an enthod of determining if adrug molecule is capable of inducing or accelerating development of fast progression of liver fibrosis in an enthod of determining it and molecule is capable of inducing or accelerating development of fast progression of liver fibrosis in an induced), a liver cancer, a non-alcoholic fatty liver disease (NAFLD), and autoimmune disease (autoimmune hepatitis (AIH), primary biliary cirrhosis (PBC), or primary sclerosing cholangitis (BCC)), a metabolic liver (cliac disease and/or a disease with secondary involvement of the liver (celiac disease and/or anyloidosis). The method and kit are useful for preventing liver cirrhosis and fast contained on the liver fibrosis. This sequence is human cytochrome P450 2D6 NNA located on the liver fibrosis. This sequence is human cytochrome P450 2D6
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting nucleotide variants e.g. 1846G-A at polymorphic sites in gene encoding cytochrome P450-2D6, by amplifying DNA variants, hybridizing tagged extension primers to amplified DNA and to probes, detecting labeled extension products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to detecting microlide variants chosen from -1584 of a polymorphic sites in the gene encoding cytochrome P450-206 (encoding debrisoquine 4-bydroxylase) comprising a life specific extension primers to complementary target sequence in amplified DNA products. Also included is a kit (1) for detecting the labeled extension products a last two tagged allele specific extension primers, where each case to fat least two tagged allele specific extension primers, where each including a 3' terminal mucleotide being either complementary to including a 3' terminal nucleotide being either complementary to including a 3' terminal nucleotide being either complementary to including a 3' terminal nucleotide being either complementary to including a 3' terminal nucleotide being either complementary to conseponding probe sequence, and where the two tagged allele specific extension primers are chosen from AE73810-AE738203 or a set of PCR amplification primers for amplifying regions of DNA containing the two polymorphic sites, appearing as AE738202-AE738209. The method is useful for detecting the presence or absence of nucleotide variants at colymorphic sites, appearing as AE738202-AE738209. The method is useful for identifying individuals who may have drug metabolism defects (adverse drug reactions) resulting from mutations in the Cyp2a6 gene, in the gene encoding CYP206. The present sequence represents the Human CYP2a6 and a multiplex method for detecting multiple mutations located in the consent sequence repeated in the ATG start coden (e.g. -1584). The method is content encoding CYP206. The present sequence repeated to the promosome 22213.1. NOTE: It is not possible to indication of the ATG start code encodence consent sequence and a without property of the code of the code of the code of the code of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to an isolated nucleic acid comprising a cytochrome P450 2D6 gene variant, e.g. G5599C or C5816AT (referring to the genomic gequence or the same variant nucleotide in the corresponding cDNA sequences). Also included are probes, primers (allele specific oligonucleotides) and arrays used to detect and or amplify the CYP2D6 gene polymorphic regions, the variant polypeptides, antibodies which are genetic deficiency for metabolising a determining whether a biplect has a genetic deficiency for metabolising a determining whether an individual is susceptible to being a poor action, evaluating therapy with a drug metabolised by P450 CYP2D6 and determining whether an individual is susceptible to being a poor wariant form of the CYP2D6 gene. The primer is useful for the cateroning whether a subject has a genetic deficiency for metabolising a determining whether a subject has a genetic deficiency for metaboliser of crugs that are subject has a genetic deficiency for metaboliser of drugs. The nucleic acids are useful as probes or primers for determining whether a subject has a genetic deficiency for metabolising a drug strain probes or primers for of drugs. The nucleic acids are useful as probes or primers for determining whether a subject has a genetic deficiency for metabolising of drugs. The nucleic acids are useful as probes or primers for determining of an individual is susceptible to being a poor metabolising determining of a subject has a genetic deficiency for metabolising a determining of a subject has or is at risk of developing a drug sensitivity, condition or disorder that is associated with an aberrant correct crust as a subject with a drug sensitivity or disorder associated with a subject with a drug sensitivity or disorder associated with a subject with a drug sensitivity or disorder associated with an aberrant CYP2D6 protein levels in an individual for determining whether a subject has a su
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New cytochrome P450 2D6 gene variants and polypeptides, useful for determining if a subject has or is at risk of developing a drug sensitivity condition or disorder that is associated with an aberrant CYP2D6 activity.

(I) is useful for identifying a diagnostic composition, which involves (a) isolating (I) from several subgroups of individuals, where one subgroup has no prevalence for CYP2D6 associated disease, and one or more further subgroup(s) do have prevalence for a CYP2D6 associated disease, and (b) identifying a single nucleotide polymorphism by comparing the nucleic acid sequence of the polynucleotide or the gene of one subgroup having no prevalence for a CYP2D6 associated
                                                                                                                                                                                                                                                                                                                                                                                                  DNA purification, SNP detection, cardiovascular-gen.; hypotensive, neuroleptic, antiarrhythmic; antiemetic; analgesic; anorectic; tranquilizer; antimanic, antiemetic, allelic variant; CYP2D6 gene; diagnosis; codeine dependence; depression; hepatitis C virus infection; psychosis; schizophrenia; Parkinsons disease; forensic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polynucleotide of molecular variants of Cytochrome P450 2D6 (CYP2D6) gene, capable of hybridizing to CYP2D6 gene, is useful in diagnosing disease related to presence of molecular variant of CYP2D6

New primer set useful for screening a polynucleotide sample to detect and

This invention relates to novel primer sets that can be used to screen a polynucleocide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. The gene is located on chromosome 22q13.1 and contains several single nucleotide polymorphisms, the details of which are disclosed in the specification. The methods and compositions of the present invention are useful for screening a polymucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene metabolism. The present sequence is that of a human cytochromome P450 isoenzyme 2D6 gene metabolism. The present sequence is that of a human cytochromome P450 isoenzyme 2D6 pseudogene which was used during the design of the primer sets of the invention to ensure specific amplification of the correct identify variants in the cytochrome P450 isoenzyme 2D6 gene, and for detecting low frequency variants affecting pharmaceutical drugs metabolism. Disclosure; SEQ ID NO 5; 51pp; English. gene sequence.

to detect and (CYP2D6) gene in a Novel primer set for screening a polynucleotide sample identify variants in the cytochrome P450 isoenzyme 2D6 polynucleotide sample or a population.

Disclosure; SEQ ID NO 5; 47pp; English.

The present invention relates to a primer set that can be used to screen a polynucleotide sample to detect and identify variants in the human cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. Also disclosed is a kit for the above screening method, a method for predicting the potential for altered metabolism of a substance, including one or more than one pharmaceutical drug, by a first individual compared to a second control

```
purified or isolated variant of wild-type CYP2D6 isoenzyme, a purified or isolated variant of wild-type CYP2D6 isoenzyme having one or more than one of the alterations chosen from F. I at position 120, F. F at position 120, E.K at position 152, R.R at position 194, F.F at position 276, H.H at position 324, R.STOP at position 344, Y. C at position 355, H.Y at position 324, V.FRAMESHIFF at position 344, Y. at position 418, H.Y at position 324, V.FRAMESHIFF at position 343, E.K at position 418, H.Y at position 478 and F.F at position 483. The primer set is useful for screening a polynucleotide sample to detect and form a small in the sample. The primer set permits amplification from a small in the sample. The primer set permits amplification from a small polynucleotide sample of selected portions of the coding portion of the cypposition of the entire coding portion of CYP2D6, as well as the flanking intronic sequences that are relevant to recognition of splice sites. The primer set further permits the detection of genetic variants of CYP2D6 without interference from pseudogenes or from homologous or paralogous genes of non-CYP2D6 cytochrome p450 genes. The primer set also permits the detection of low frequency variants that are relevant to recognition confiner set also permits the detection of low frequency variants that are relevant as the false negative rate in variant screening. The present sequence represents a numan pseudogene located on chromosome 22q near the CYP2D6 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

New primer set useful for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene, and for detecting low frequency variants affecting pharmaceutical drugs metabolism.

Disclosure; SEQ ID NO 6; 51pp; English.

This invention relates to novel primer sets that can be used to screen a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene. The gene is located on chromosome

```
The present invention relates to a primer set that can be used to screen a polynucleotide sample to detect and identify variants in the human cytochrome P450 isoenzyme 206 (CYP2D6) gene. Also discolsed is a kit for the above screening method, a method for predicting the potential for altered metabolism of a substance, including one or more than one than one a parameter of parameteutical drug, by a first individual compared to a second control individual, where the substance is metabolised by the CYP2D6 isoenzyme, a purified or isolated variant of wild-type CYP2D6 isoenzyme having one or core than one of the alterations chosen from F-1 at position 120, F-F at position 120, E-K at position 155, R-R at position 344, R-STOP at position 344, Y-C at position 354, H-A at position 361, V-FRAWESHIFT at position 363, B-K at position 408 and P-F at position 483. The primer set is useful for screening a polynucleotide sample to detect and clentify the presence of one or more than one variant in the CYP2D6 gene
                                                                                                                                                                                                                                                                            ö
                of which are disclosed in the specification. The methods and compositions of the present invention are useful for screening a polynucleoride sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene and detecting low frequency variants affecting pharmaceutical drugs metabolism. The present sequence is that of a human cytochromome P450 isoenzyme 2D6 pseudogene which was used during the design of the primer sets of the invention to ensure specific amplification of the correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in a

The gene is located on chromosome 22q13.1 and contains several single nucleotide polymorphisms, the details of which are disclosed in the specification. The methods and compositions of the present invention are useful for screening a polymucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene metabolism. The present sequence is that of a human cytochromome p450 isoenzyme 2D6 pseudogene which was used during the design of the primer sets of the invention to ensure specific amplification of the correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New primer set useful for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 gene, and for detecting low frequency variants affecting pharmaceutical drugs metabolism.
in the sample. The primer set permits amplification from a small polynucleotide sample of selected portions of the coding portion of the CYP2D6 gene, or amplification of the entire coding portion of CPP2D6, as well as the flanking intronic sequences that are relevant to recognition of splice sites. The primer set further permits the detection of genetic variants of CYP2D6 without interference from pseudogenes or from homologous or paralogous genes of non-CYP2D6 cytcohrome p450 genes. The primer set also permits the detection of low frequency variants that affect pharmaceutical drugs metabolism, thereby decreasing the false negative rate in variant screening. The present sequence represents a human pseudogene located on chromosome 22q near the CYP2D6 gene.
                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       primer set; variant identification; cytochrome P450 isoenzyme 2D6; CYP2D6; chromosome 22q13.1; single nuclectide polymorphism; SNP; low frequency variant; pharmaceutical drugs metabolism; human; pseudogene; ds.

The present invention relates to a primer set that can be used to screen a polymucleotide sample to detect and identify variants in the human cycohymucleotide sample to detect and identify variants in the human cycohymucleotide sample to detect and identify variants in the human cycohymucleotide a method for predicting the potential for altered metabolism of a substance, including one or more than one of paramaceutical drug, by a first individual compared to a second control individual, where the substance is metabolised by the CYP2D6 isoenzyme, a purified or isolated variant of wild-type CYP2D6 isoenzyme having one or concert than one of the alterations chosen from F-1 at position 120, F-F at position 120, E-K at position 155, H-H at position 354, R-STOP at position 344, Y-CC cat position 355, H-H at position 361, V-FRAMESHIFT at position 363, E-K at position 355, H-H at position 361, V-FRAMESHIFT at position 363, E-K at position 355, H-H at position 361, V-FRAMESHIFT at position 363, E-K at position 418, H-Y at position 361, V-FRAMESHIFT at substitution 355, H-H at position 361, V-FRAMESHIFT at substitution 355, H-H at position 361, V-FRAMESHIFT at substitution 355, H-H at position 361, V-FRAMESHIFT at substitution 363, E-K at position 418, H-Y at position 361, V-FRAMESHIFT at substitution 363, E-K at position 418, H-Y at position 361, V-FRAMESHIFT at substitution of the primer set permits amplification from a small columnia sequence of one or more than one variant in the CYP2D6 gene or amplification of the entire coding portion of the entire coding portion of cyple of sequences that are relevant to recognition of substitutes of CYP2D6 gene, or amplification of the entire coding portion of genetic variants of CYP2D6 without interference from pseudogenes or from variants of CYP2D6 promits the detection of genetic complete set also permits the detection of low frequency variants that the paramaceutical drugs metabolism, thereby decreasing the false
                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel primer set for screening a polynucleotide sample to detect and identify variants in the cytochrome P450 isoenzyme 2D6 (CYP2D6) gene in a polynucleotide sample or a population.
                                                                                                                         Gaps

The invention relates to a method of determining if an individual is predisposed to fast progression of liver fibrosis or liver cirrhosis comprising determining a presence or absence, in a homozygous or comprising determining a presence or absence, in a homozygous or heterozygous form, of at least one fast progression liver fibrosis.

C heterozygous form, of at least one fast progression liver fibrosis.

Sasociated genotype in the CYP2D6, CYPAB5, CYP2B1, or APO B locus or in neighboring loci of the individual, where the neighboring loci is in linkage disequilibrium with the locus, thus determining if the individual is predisposed to fast progression of liver fibrosis; a kit to carry out the method; a method of preventing fast progression and/or activity; and a nidividual, by upregulating CYP2D6 expression and/or activity; and a cocelerating development of fast progression of liver fibrosis in an individual. The individual is suffering from a hepatitis viral infection caused by hepatitis B, C or D virus, a hepatotoxicity (alcohol- or drug-induced), a liver cancer, a non-alcoholic fatty liver disease (NAFLD), and autoimmune disease (autoimmune hepatitis (PSC)), a metabolic liver

ö
a disease with secondary involvement of the liver (celiac disease and/or amyloidosis). The method and kit are useful for determining if an individual is predisposed to fast progression of liver fibrosis. The method and drug are useful for progression of liver fibrosis. The progression of liver fibrosis. The progression of liver fibrosis and fast progression of liver fibrosis. This sequence is human cytochrome P450 2D6 DNA neighboring loci.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dubuque, T.,
products were purified by phenol/chloroform and Centricon 100. The CDNAs were digested with SalI and NotI enzymes and cloned into SalI/NotI site of pSPORTI plasmid vector. The DH100B E. coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.5 kb. The library was constructed by Yulan Piao (NIA)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Vector: pT/T3D-PacI; Site_1: Not I; Site_2: Eco RI;
lst strand cDNA was primed with a Not I - oligo(dT) primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I;
Ul-E-Bal is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, e:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGANTCRAGA; lens, CGANTAGCGA; eye anterior segment, AATGCGCGAT; optic nerve, CCATTAAGTG; retina, CGCG; Retina Foveal and Macular, GTCC; REE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

10.5 Kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMUA2 (gi|4732114 gpl.AP129072.1), a copy-number of inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored by completent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bukaryota, Merazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
